Kelechi **Ogbonnaya**

Backend Engineer

(+234) 814-854-7807 kelechiogbonnaya2020@gmail.com https://github.com/deltron-fr Kelechi Ogbonnaya

Profile

Backend engineer working in Go and Python, with experience owning architecture, authentication, access control, and finance workflows for a production ERP. Regular contributor to Lima (CNCF). Strong in API design, data modeling, testing, and CI/CD.

Skills

Languages	**Go**, **Python**, **SQL**, **Bash**
Backend	**REST APIs**, **Authentication**, **PostgreSQL**, **SQLite**, **Django Ninja**, **sqlc**, **OpenAPI**
Tooling	**Docker**, **GitHub Actions**, **Nginx**, **Azure DevOps**, **Linux**, **Git**
Cloud	**Terraform**, **AWS**, **Azure**, **Kubernetes**, **Ansible**

Experience

Backend Developer — Enugu, Nigeria

Bomach Group — Feb 2026 - Present

- Develop and extend an internal ERP that moved daily paper work reports and physical leave requests into the system and gave the sales team a single place for invoicing and payment tracking.
- Led the rearchitecture of the legacy Django / Django Ninja codebase into a modular monolith with 10+ business domains (finance, HR, CRM, real estate, services), migrating 120 models across 200+ migrations without breaking existing API contracts.The clearer structure made the code easier for new developers to follow and for AI coding agents to work in.
- Designed a reusable permission layer that enforces branch-scoped vs. company-wide access through per-resource permission keys (create, view, approve, etc.), applied declaratively across the API for every role from intern to CEO.
- Built the Finance module end to end (invoicing, AR ageing, payment review and posting, ledger-based wallets, vendor payables, cashbook) and cross-domain executive dashboards, backed by 600+ tests.

DevOps Engineer Intern — Remote

Coils Tech — Jan 2024 - Apr 2024

- Provisioned Azure infrastructure as code with Bicep and built Azure DevOps CI/CD pipelines, cutting manual deployment work.
- Deployed and scaled containerized applications across Azure Virtual Machines.

Open Source

Lima — github.com/lima-vm/lima

CNCF project: Linux virtual machines with a focus on running containers (Go)

- Made `limactl menu` return to the menu after an action instead of exiting (#5632).
- Fixed the menu Info page to show memory and disk in binary units (#5637).
- Added support for editor commands with arguments (such as $EDITOR with flags) by parsing them with shellwords, with tests for quoting, fallback behavior and Windows paths (#5640).
- Improved menu text contrast across light and dark terminal themes, iterating on maintainer review before merge (#5658).

Projects

Simila — github.com/Parakliite/Simila-backend

- Built the Go backend for a social taste app where users rate films and shows, react to ratings, and are matched by taste similarity.
- Designed the auth system: access tokens, rotating refresh tokens, session IDs, account activation and protected API middleware.
- Modeled the PostgreSQL schema (users, media, ratings, reactions, watchlists, matches) with goose migrations and typed sqlc queries, and documented the API with OpenAPI.
- Added endpoint tests and CI with formatting checks, static analysis and gosec.
- Tech: Go, PostgreSQL, sqlc, goose, OpenAPI, GitHub Actions.

MIRA **https://github.com/jerrygeorge360/mira**

- Co-built memory infrastructure for AI agents that stores conversational experience as structured, inspectable memory, separating session-local working state from durable cross-session memory.
- Improved LLM reliability with structured JSON output handling: Markdown-fence stripping, schema validation and repair guards for malformed model responses.
- Added response traceability by recording retrieval sources, prompt sections and memory usage for each answer, so memory behavior can be inspected and evaluated.
- Owned deployment and the Slack integration: Slack Bolt bot, Docker Compose, GitHub Actions CI/CD, and Nginx routing with TLS.
- Tech: Python, Slack Bolt, Docker Compose, GitHub Actions, Nginx.

govisor **github.com/deltron-fr/govisor**

- Built a Linux process supervisor driven by a YAML config, with a CLI and an HTTP API over Unix domain sockets for applying configs, checking status, reading logs and stopping processes.
- Implemented restart policies with exponential backoff, graceful shutdown, per-process log files and log rotation, with tests across client, server, config parsing and supervisor behavior.
- Tech: Go, Linux, Unix Domain Sockets, Cobra, YAML.

Education

University of Nigeria **Nigeria**

B.Eng. in Electronics and Computer Engineering Aug 2021 - Sept 2025

Certifications

Microsoft Certified: Azure Fundamentals (AZ-900)

Microsoft

Kubernetes and Cloud Native Associate (KCNA)

Linux Foundation
