Kelechi **Ogbonnaya**

Systems Engineer · Infrastructure / Platform Engineer

(+234) 814-854-7807 kelechiogbonnaya2020@gmail.com https://github.com/deltron-fr Kelechi Ogbonnaya

Profile

Go-focused systems engineer with experience building infrastructure tools, contributing to Lima (CNCF), and developing production software. Skilled in Linux, networking, process management, storage systems, and CI/CD.

Skills

Languages	**Go**, **Python**, **SQL**, **Bash**
Systems Engineering	**Linux**, **Process Management**, **Concurrency**, **Unix Domain Sockets**, **Shell Internals**, **Storage Engines**, **TCP/IP**, **CLI Development**
Infrastructure & Cloud	**Docker**, **Kubernetes**, **Terraform**, **Azure**, **AWS**, **CI/CD**, **Infrastructure as Code**, **Prometheus**
Engineering Tools	**Git**, **GitHub Actions**, **PostgreSQL**, **Automated Testing**, **Static Analysis**

Experience

Backend Developer — Enugu, Nigeria

Bomach Group — Feb 2026 - Present

- Develop and extend an internal ERP that moved daily paper work reports and physical leave requests into the system and gave the sales team a single place for invoicing and payment tracking.
- Led the rearchitecture of the legacy Django / Django Ninja codebase into a modular monolith with 10+ business domains (finance, HR, CRM, real estate, services), migrating 120 models across 200+ migrations without breaking existing API contracts.The clearer structure made the code easier for new developers to follow and for AI coding agents to work in.
- Designed a reusable permission layer that enforces branch-scoped vs. company-wide access through per-resource permission keys (create, view, approve, etc.), applied declaratively across the API for every role from intern to CEO.
- Built the Finance module end to end (invoicing, AR ageing, payment review and posting, ledger-based wallets, vendor payables, cashbook) and cross-domain executive dashboards, backed by 600+ tests.

DevOps Engineer Intern — Remote

Coils Tech — Jan 2024 - Apr 2024

- Automated Azure infrastructure provisioning using Bicep, applying infrastructure-as-code practices to resource deployment and management.
- Configured CI/CD pipelines in Azure DevOps to streamline application delivery and reduce manual deployment steps.
- Managed containerized application deployments on Azure Virtual Machines, supporting service availability and resource utilization.

Open Source

Lima — github.com/lima-vm/lima

CNCF project: Linux virtual machines with a focus on running containers (Go)

- Made `limactl menu` return to the menu after an action instead of exiting (#5632).
- Fixed the menu Info page to show memory and disk in binary units (#5637).
- Added support for editor commands with arguments (such as $EDITOR with flags) by parsing them with shellwords, with tests for quoting, fallback behavior and Windows paths (#5640).
- Improved menu text contrast across light and dark terminal themes, iterating on maintainer review before merge (#5658).

Projects

govisor — github.com/deltron-fr/govisor

- Built a Linux-focused process supervisor for managing long-running services from declarative YAML configuration.
- Implemented a CLI and client-server interface over Unix domain sockets for applying configurations, inspecting process status, retrieving logs, and stopping services.

- Implemented process lifecycle management with restart policies, exponential backoff, graceful shutdown, per-process logs, and log rotation.
- Added focused tests covering configuration parsing, client-server behavior, log retrieval, and supervisor execution.
- Tech: Go, Linux, Unix Domain Sockets, Cobra, YAML.

gash **github.com/deltron-fr/dshell**

- Built an interactive Unix-like shell in Go supporting builtins, external commands, pipelines, I/O redirection, command history, tab completion, and background jobs.
- Implemented command parsing for quoting, escaping, redirection operators, background execution, and shell parameter expansion.
- Developed custom terminal input handling with raw mode, history navigation, executable and file completion, and extensible completion scripts.
- Tech: Go, Linux, Shell Internals, Terminal I/O.

Warden **github.com/deltron-fr/warden**

- Developed an HTTP/1.1 reverse proxy in Go, implementing TCP-based request handling, HTTP parsing, and request/response forwarding.
- Implemented configurable path-based routing to multiple upstream servers with round-robin load balancing.
- Built upstream connection handling, proxy error responses, YAML-based configuration, and graceful shutdown on termination signals.
- Tech: Go, TCP/IP, HTTP/1.1, Networking, YAML.

Education

University of Nigeria **Nigeria**

B.Eng. in Electronics and Computer Engineering Aug 2021 - Nov 2025

Certifications

Kubernetes and Cloud Native Associate (KCNA)

Linux Foundation

Microsoft Certified: Azure Fundamentals (AZ-900)

Microsoft
